1. Do you think an engineer should also be good in written communication? Why? Explain and justify your thoughts.

Yes, I think an engineer should be good at written communication because engineers need to explain their ideas and work clearly. They may need to write reports, instructions, emails, or other documents that people will use as a guide. If the information is not written properly, it can cause confusion or mistakes. Being able to write clearly can help an engineer communicate better with coworkers, clients, and other professionals.

2. How would you differentiate oral communication from engineering graphical communication?

Oral communication is when we use spoken words to explain or share information with other people. Engineering graphical communication uses drawings, diagrams, symbols, and measurements to show technical information visually. For example, an engineer can explain a design through a conversation, but a technical drawing can show its exact shape, size, and measurements. Both are useful because they help engineers explain their ideas in different ways.

3. As a future engineer, how would you justify the popular phrase "Communication is the key" in workplace?

As a future engineer, I think communication is important because engineers often work with different people as part of a team. Good communication helps everyone understand their responsibilities, share ideas, and solve problems together. If people do not communicate properly, mistakes and misunderstandings can easily happen, which may affect the whole project. That is why I believe technical skills and good communication should go together in the workplace.
